

Academic Assessment Evaluator Report

Bank ACC-C1C2-2026.27 / schema 2.25.0. Attempt pdf-pipeline-sample. Generated 2026-06-26T21:17:20.536363+00:00.

Evaluator-only report. Includes scoring keys, rationales and timing evidence for authorized review.

Attempt Summary

Metric	Value
Submitted	3
Weighted percent	0.3333
Report boundary	authorized evaluator

Responses

ID	Skill	Selected	Correct	Score	Time	Rationale
ACC_001	Reading Synthesis	D	D	1	91	The correct answer is D because it preserves the passage's concessive structure: a diffusion-based architecture for joint modelling of proteins, nucleic acids, ligands and ions is valuable, but the warrant is limited by scope, validation and training-set proximity. The false-synchrony distractor reverses the relation between method and limitation. The overgeneralisation distractor treats a bounded case in computational structural biology as a universal rule. The modal-distortion distractor turns qualified evidence into permanent verification. The out-of-context distractor is plausible policy prose, but it does not answer the rhetorical question.
ACC_101	Use of Academic English	A, C	B, C, D	0	126	The correct answer set is B, C, D. These choices preserve the claim while reducing over-certainty in the opening claim, keeping predictor information asymmetry as an interpretive constraint and, when required, limiting transfer beyond social and behavioural science claims. The incorrect options enact two traps: changing "may inform" to "must determine" is modal inflation, and making the caveat an effect of the method creates false synchrony. Partial credit is psychometrically justified because each selection tests an independent layer of lexical, syntactic and stance control.
ACC_201	Data Interpretation	B	E	0	144	The correct answer is E because it maps the numerical direction of the finding to cautious prose while preserving uncertainty, missingness and sensitivity to opacity degeneracy. The false-synchrony distractor treats sensitivity analysis as proof of fabrication rather than model dependence. The overgeneralisation distractor turns a positive interval into universal causality. The modal-distortion distractor implies sample size automatically removes missing-data bias. The out-of-context funding distractor may sound reasonable outside the passage, but it does not answer the methodological interpretation task.
